## Contact Testers and Amplifiers

The CONTACT TESTER shown above is a testing device to be used when one wants to check the tone sound of the receiver in the actual field. It can also be used to sound test the receiver in your test field.

If you are having a problem hearing the tone sound, use the AMPLIFIER. It is much louder and will accentuate the sound.

Arc testing should not be done with a screwdriver or other method as the transformer in the receiver may be damaged.

Both of these devices should be in your tool box. Amplifiers are available for customers who cannot hear the receiver tone.

Please call us with any questions.
