## DGM4 Receiver (a.k.a Micro Receiver)

### Features

The DGM4 receiver, also known as the Micro Receiver, is designed to contain "tiny pets" weighing 1 to 10 pounds.

This receiver is water-resistant provided it was not damaged or abused.

The fail-safe feature shuts the receiver down 30 seconds after it has been activated. The receiver will reset itself once it has been removed from the signal field for 3 seconds. This feature ensures that your pet will not be continuously stimulated if accidentally caught in the signal field.

The DGM4 receiver provides a pulsating stimulus, so that your Dog Guard professional dealer can adjust the stimulus to match your pet's temperament.

The receiver in the encoded mode provides up to 32 levels of initial stimulation that are controlled at the transmitter. When the pet enters the first signal field, it will receive a warning tone or stimulation. Should the pet stray into the second signal zone, the receiver will automatically increase to a stronger stimulus. The maximum stimulus can be controlled by using shunts.

It is available in two frequencies.

**Dimensions:** 1 1/8" W x 1" H x 1 7/8" L

**Probe Spacing:** 1 1/8"

**Weight:** 1.8 oz.

Your Dog Guard® professional dealer will answer any questions that you have and also help you pick the equipment that is right for you and your pet.
